

## **The Mind's Interaction with the Laws of Physics and Cosmology**

### **Extracts from the Review in the Journal of Scientific Exploration**

**Jeffrey Keen's book is a highly ambitious and serious inquiry that is most likely intended for the scholarly or serious dowers, although quite readable, perhaps to allow others to confirm his observations.**

**He offers a deep and (in my view) fascinating exploration into different kinds of subtle energies, which range from lines across the landscape, auras (for both living and non-living forms), vorticular energies, "psi-lines," and others.**

**Keen is eager to quantify everything he can, often in surprising ways. Many of his findings are counter-intuitive, as well as intriguing. His detailed charts and illustrations demonstrate how various properties vary with distance or time. Also, his use of equations to ascertain the relationships on various aspects of subtle energy observations is impressive. Almost needless to say, Keen is especially interested in mathematical constants and series, such as phi and Fibonacci's sequence.**
